## Symbols and Abbreviations

The following symbols and abbreviations, and others approved for the Système International d'Unités (SI), are used without definition in the following reports by the Divisions of Sport Fish and of Commercial Fisheries: Fishery Manuscripts, Fishery Data Series Reports, Fishery Management Reports, and Special Publications. All others, including deviations from definitions listed below, are noted in the text at first mention, as well as in the titles or footnotes of tables, and in figure or figure captions.

<b>Weights and measures (metric)</b>		<b>General</b>		<b>Mathematics, statistics</b>

March 2011

The Fishery Management Reports series was established in 1989 by the Division of Sport Fish for the publication of an overview of management activities and goals in a specific geographic area, and became a joint divisional series in 2004 with the Division of Commercial Fisheries. Fishery Management Reports are intended for fishery and other technical professionals, as well as lay persons. Fishery Management Reports are available through the Alaska State Library and on the Internet: <http://www.sf.adfg.state.ak.us/statewide/divreports/html/intersearch.cfm>. This publication has undergone regional peer review.

## ABSTRACT

This report is intended to be a reference document of escapement data collected during the past 10 years on weirs that were operational in 2010 and from aerial and foot surveys conducted in 2010. Discussion and analysis are not included in this document.

In 2010, the Alaska Department of Fish and Game operated nine fish counting weirs and one fish pass in the Kodiak Management Area (KMA). Operation of these weirs began in mid-May and continued through the middle of September, depending upon the run timing of salmon populations in the different systems. The data from the weirs provided the basis for inseason management actions regulating the commercial, sport, and subsistence fisheries in the KMA.

Surveys are also conducted from fixed wing single engine aircraft and by foot on other area salmon streams without weirs, to facilitate inseason assessment of stock status. A combined total of 5,124,667 salmon were counted by weirs, and foot and aerial surveys in the KMA during 2010. The total consisted of 8,579 Chinook, 1,095,458 sockeye, 76,212 coho, 3,644,133 pink and 300,285 chum salmon.

Key words: salmon, Chinook, *Oncorhynchus tshawytscha*, sockeye, *Oncorhynchus nerka*, coho, *Oncorhynchus kisutch*, pink, *Oncorhynchus gorbuscha*, chum, *Oncorhynchus keta*, Dolly Varden, *Salvelinus malma*, Steelhead, *Oncorhynchus mykiss*, escapement, weir, Kodiak, indexed, KMA, CF, KRAA, FMR, SF, ADF&G

## INTRODUCTION

Weir and aerial survey counts are critical for the management of commercial salmon fisheries in the Kodiak Management Area (KMA). Escapement information provides the basis for ensuring biological stability and is the foundation for inseason management actions that regulate commercial, sport, and subsistence harvest of salmon. When weir counts are not available, aerial surveys are used to estimate salmon escapement. Five species of Pacific salmon are enumerated: Chinook *Oncorhynchus tshawytscha*, sockeye *O. nerka*, coho *O. kisutch*, pink *O. gorbuscha*, and chum salmon *O. keta*, as well as steelhead trout *O. mykiss* and Dolly Varden *Salvelinus malma*.

From 2001 to 2010, the number of weirs operating each year in the KMA has fluctuated due to funding. A total of nine weirs and one fish pass were operated in 2010. These weirs were located at Karluk River, Ayakulik River, Dog Salmon Creek (including Frazer fish pass), Upper Station (Olga Creek), Litnik (Afognak River), Buskin River, Saltery River, Big Bay Creek, and the outlet of Lake Louise (Table 1; Figure 1).

Operation of these weirs typically occurs from mid-May or early June to August or late September, depending upon the run timing of salmon populations in a particular system (Table 2). Pre- and post-weir estimates are comprised of aerial, skiff and foot surveys. Occasionally, additional estimates of escapement are required when the integrity of the weir is compromised from events such as high water or bear activity. These estimates are derived from foot surveys or extrapolations based on visual observations and daily escapements before and/or after the disturbance of the weir.

Most weirs operated in the KMA were funded and operated by Alaska Department of Fish and Game (ADF&G), Division of Commercial Fisheries (CF). The Kodiak Regional Aquaculture Association (KRAA) provides funding to assist with the operation of some weir projects through a cooperative agreement with ADF&G. The ADF&G Division of Sport Fish (SF) operated the Buskin River coho salmon weir, financed by a split between state fish and game funds and federal funds coming from the Dingell-Johnson Act. The Buskin River sockeye salmon and Lake Louise weirs were partially financed by U. S. Fish and Wildlife Service, Office of Subsistence

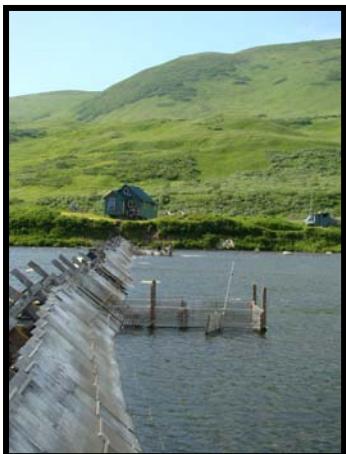

Management. The Alaska Department of Natural Resources, Division of State Parks runs the Big Bay coho weir.

This report is intended to be used as a reference document for escapement data collected during the past 10 years on weirs that were operational in 2010 (Tables 3–53). This report provides the reader with data only. Discussion and analysis can be found in the yearly Kodiak Area Management Report. The reader should note that years not listed in the 10-year escapement tables indicate that the weir was not in operation that year. Weirs operated in the past can be found in Tiernan and Caldentey (2010) and other past reports of this series.

## WEIR OPERATION

Well-built and adequately staffed weirs permit relatively accurate identification and enumeration of adult salmon during their upstream spawning migration. Weirs are structures that span the width of a river to allow the assessment of the upstream migration of fish. In the KMA, weirs are made from a framework of wooden tripods (weighted with sandbags or large rocks), timbers, and a boardwalk. Aluminum panels, made of one-inch pipe spaced one inch apart, are placed on the upstream side of the weir framework creating a barrier to fish migration. Weirs are monitored throughout the day for upstream-migrating salmon accumulating on the downstream side of the weir. When fish are present, gates in the weir are opened and fish are individually counted and identified by species with hand-held counters as they pass through the weir gate and travel upstream to spawning grounds. For detailed weir operations on specific KMA systems, refer to Caldentey (2010).

## KODIAK MANAGEMENT AREA WEIRS

### KARLUK RIVER

The Karluk River weir is approximately 101 m (330') long and is located about 1.3 km (0.8 mi) upstream of the confluence of the Karluk River and Karluk Lagoon, on the southwest side of Kodiak Island (Figure 1). The weir was first constructed in 1921 at its current location and was operated annually at this location until 1941. The weir was moved to “the portage,” approximately 12.9 km (8 mi) downriver from the Karluk Lake outlet from 1942 to 1945. Between 1946 and 1975 it was operated at the outlet of Karluk Lake. It was re-established at its present location in 1976. The weir is operated by two to four CF employees from mid-May to late

September. In 2010, one SF employee assisted with weir operations during the Chinook salmon run from mid-May until approximately July 15. Daily and cumulative escapement counts by species for 2010 are listed in Table 4. Escapement counts, by species, from 2001 to 2010 are presented in Tables 5 through 10. The Karluk system has two distinct runs of sockeye salmon; the early run prior to and including 15 July, and the late run occurring post 15 July.

## AYAKULIK RIVER

The Ayakulik River weir is approximately 35 m (120') long and is located about 1.3 km (0.8 mi) upstream from the outlet of the Ayakulik River into the Shelikof Strait, on the southwest side of Kodiak Island (Figure 1). Ayakulik River weir was originally constructed in 1929 at the outlet of Red Lake and operated at that location until 1969. The weir has been at its current location since 1970. The weir is operated by two CF employees from late May to early September. In

2010, one SF employee assisted with weir operations during the Chinook salmon run from mid-May until approximately 15 July. Daily and cumulative escapement counts, by species, for 2010 are listed in Table 11. Escapement counts, by species, from 2001 to 2010 are presented in Tables 12 through 16.

## DOG SALMON CREEK

The Dog Salmon Creek weir project consists of three weirs, 38 m (125'), 41 m (135'), and 8 m (25') in length, on the three lower forks of the Dog Salmon Creek, 0.5 km (0.3 mi) upstream of their outlets into Olga Bay, on the south end of Kodiak Island (Figure 1). The Dog Salmon Creek flows from Frazer Lake. First constructed in 1983, the weirs are usually operated by two CF employees from early June to late August. Daily and cumulative escapement counts, by

species, for 2010 are listed in Table 17. Escapement counts by species from 2001 to 2010 are presented in Tables 18 through 22.

## FRAZER FISH PASS

The Frazer fish pass consists of a diversion weir and a series of "fish ladders". The diversion weir directs fish to the entrance of the fish pass. The fish pass is a series of raceways 60 m (197') long with a gradual slope of 22%. This allows salmon to ascend a barrier falls approximately 9 m (30') tall, which are located near the outlet of Frazer Lake on the Dog Salmon Creek at the south end of Kodiak Island (Figure 1). Counts are made at the upstream portion of the fish pass.

Constructed in 1962 to accommodate sockeye salmon stocks introduced in 1951. In 2010, the fish pass was operated by two KRAA funded employees and supervised by an ADF&G project biologist from mid-May to mid-August. Frazer Lake sockeye salmon are first counted through the Dog Salmon Creek weirs to manage commercial fisheries in the Alitak District. The salmon are then counted again as they exit the fish pass to ensure a sustainable population reaches Frazer Lake. Daily and cumulative escapement counts by species for 2010 are listed in Table 23. Escapement counts, by species, from 2001 to 2010 are presented in Tables 24 through 26.

## UPPER STATION (OLGA CREEK)

The Upper Station (Olga Creek) weir is approximately 11 m (35') long and is located near the outlet of Olga Creek where it drains into upper Olga Bay, on the south end of Kodiak Island (Figure 1). The weir was first constructed in 1929 just above the lagoon, approximately 0.23 km (0.14 mi) upstream of its current location, and was operated there until 1969. From 1969 to 1992, the weir was operated near the outlet of lower South Olga

Lake. The weir was moved to its current location in 1993. The weir is operated by two CF employees from late May to mid-September. The Upper Station system has two distinct runs of sockeye salmon; an early run prior to and including 15 July, and a late run which occurs post 15 July. Daily and cumulative escapement counts by species for 2010 are listed in Table 27. Escapement counts, by species, from 2001 to 2010 are presented in Tables 28 through 31.

## LITNIK (AFOGNAK RIVER)

The Litnik (Afognak River) weir is approximately 27 m (88') long and is located about 0.8 km (0.5 mi) above the outlet of the Afognak River, which flows into Afognak Bay, on the south end of Afognak Island (Figure 1). A weir was first constructed in 1921, at a site located approximately 0.64 km (0.4 mi) below the outlet of Afognak Lake, where intermittent weir counts occurred up to 1978, then annually until 1985. In 1986 it was moved to

its current location and has been operated there since. The Litnik weir is operated by two CF employees from late May to mid-September. Daily and cumulative escapement counts by species for 2010 are listed in Table 32. Escapement counts, by species, from 2001 to 2010 are presented in Tables 33 through 36.

## BUSKIN RIVER

The Buskin River weir is approximately 38 m (125') long and was first constructed in 1985 approximately 1.6 km (1 mi) above the outlet of the Buskin River, which flows into Chiniak Bay on the northeast side of Kodiak Island (Figure 1). In 1990, a 33 m (109') weir was constructed at the outlet of Buskin Lake, approximately 6.4 km (4 mi) above the lower weir site. This location was chosen to avoid the frequent washouts that occur at the lower site

and to assure a consistent and accurate count of sockeye salmon from mid-May through late July. In past years, the weir is moved annually from the upper site to the lower site in late July or early August to obtain an accurate coho salmon count. In 2010, two SF employees operated the upper weir from May 21 to October 7 and the lower weir from July 29 to September 29. Escapement counts for sockeye salmon and steelhead were measured at the upper weir while the Chinook,

coho, pink, and chum salmon are measured at the lower weir and are listed in Table 37. Escapement counts, by species, from 2001 to 2010 are presented in Tables 38 through 41. Because the Lake Louise weir is upstream of the lower Buskin weir site but the confluence of Lake Louise is below the Lake weir site, the escapement for the Buskin River drainage is considered to include the Buskin River weir cumulative counts plus the sockeye salmon cumulative counts through Lake Louise weir.

## LAKE LOUISE

The Lake Louise weir is 9 m (30') long and is located approximately 0.8 km (0.5 mi.) above the confluence of the Buskin River and the tributary creek draining Lake Louise (Figure 1). A weir was used in this location in the 1970s and 1980s to estimate out migrating juvenile salmon abundance, and a Dolly Varden mark-recapture study in 1992. Since 2002, the Lake Louise weir has been operated from approximately June 1 through September 15 by two SF employees who are also responsible for the operation and maintenance of the Buskin River weir. Daily and cumulative escapement counts by species for 2010 are listed in Table 42. In 2010, all species, except sockeye salmon, are also counted at the lower Buskin weir and so not included in total escapement for the Buskin River drainage. Escapement counts, by species, from 2002 to 2010 can be found in Tables 43 through 45.

## SALTERY RIVER

The Saltery River weir is approximately 37 m (120') long and is located about 0.4 km (one-quarter of a mile) below the outlet of Saltery Lake, on the northeast side of Kodiak Island (Figure 1). Saltery weir was first constructed and installed in 1985. During the first 3 years of operation, it was placed in various locations closer to the lagoon. In 1988, it was moved to its present location due to instability and a shifting river bed and operated there until 2003 and again from 2008 through 2010. In 2010, the Saltery weir was operated by two KRAA employees and supervised by an ADF&G project biologist from early June to early August. Daily and cumulative escapement counts by species for 2010 are listed in Table 46. Escapement counts, by species, from 2001 to 2010 can be found in Tables 47 through 50.

## BIG BAY CREEK

The Big Bay Creek weir is approximately 9 m (30') long and is located at the head of Big Bay on the west side of Shuyak Island (Figure 1). First constructed in 1988, the weir is normally operated by volunteers and employees of the Alaska Department of Natural Resources (ADNR) Division of State Parks from early August to mid-September. ADF&G Commercial Fisheries Management provides weir materials and logistical support. The Big Bay Creek weir

was not operated in 1997, 1999 and 2003 to 2006. Daily and cumulative escapement counts by species for 2010 are listed in Table 51. Escapement counts by species from 2001 to 2010 can be found in Tables 52 through 53.

## PEAK ESCAPEMENTS

Most pink and chum salmon escapement estimates were collected from fixed-wing aircraft surveys of bays and streams. Coverage of coho salmon systems was incomplete due to poor weather conditions for conducting surveys and limited budgets. Foot surveys were also conducted on a few streams, primarily along the Kodiak road system. Aerial and foot survey counts were considered an index of the actual escapement for use in season to aid fishery management. Peak indexed escapement was calculated postseason for all systems surveyed and, together with weir escapement data, was used to estimate an area-wide escapement. Peak escapement for sockeye, chum and coho salmon was derived from the highest daily aerial or foot survey count for each system for each year. For pink salmon, peak escapement of each stream surveyed was estimated as the larger of either the highest daily survey count or the sum of two counts which were 30 or more days apart. All escapement values in past Annual Management Reports are total counts from weirs plus peak index counts, and this document follows that methodology in Tables 54 through 61.

## ACKNOWLEDGMENTS

Sincere gratitude is extended to all of the seasonal weir camp employees throughout the past ten years who have enumerated the escapements that support this document. Appreciation is also extended to the dedicated Westward Region Finfish Management staff, and office staff for coordinating, supporting and documenting this effort.

10. Big Bay Creek <sup>h</sup>	8/5	9/7	0	3	1,999	3,305	0
Totals			8,569	977,596	45,343	2,131,305	4,039

<sup>a</sup> Includes post weir estimate of 90,000 sockeye salmon and 12,000 coho salmon.

<sup>b</sup> Includes post weir estimate of 45,400 sockeye, 1 Chinook, 219,000 pinks, 123 coho, and 20 chum. Also includes a subtraction of 10 Chinook salmon due to upriver sport fish harvest.

<sup>c</sup> Includes post weir estimate of 1,000 sockeye, 77,500 pinks, 50 coho, and 200 chum.

<sup>d</sup> Frazer Lake fish pass count is considered the best escapement estimate of sockeye salmon so the Dog Salmon sockeye salmon count is omitted from the totals, and the Frazer counts are omitted from the totals for all other species.

<sup>e</sup> Includes post weir estimate of 500 sockeye and 300 coho.

<sup>f</sup> Includes post weir estimate of 4,500 pinks and 1,500 coho.

<sup>g</sup> All species of salmon, with the exception of sockeye, were already counted at the lower Buskin River weir and so are not summed in totals.

<sup>h</sup> Includes post weir estimate of 60 pinks and 20 coho.

<sup>a</sup> The Buskin River has two weirs located on it, the lower one is to get accurate counts for coho salmon.

<sup>b</sup> In 2010, the Buskin Lake weir was not removed until end of season.

Table 11.–Page 3 of 3.

- 
- <sup>a</sup> Weir fish tight at 17:30 PM on May 21.
  - <sup>b</sup> Weir out due to high water between the hours of 19:45 PM on June 14th to 12:39 on June 17; estimated 12,245 sockeye and 103 Chinook salmon.
  - <sup>c</sup> Hole in weir; estimated 275 sockeye, 2 pinks, and 15 Chinook salmon.
  - <sup>d</sup> Weir out due to high water and debris; estimated 1,400 sockeye, 6 Chinook, 3,300 pink salmon.
  - <sup>e</sup> Weir out due to high water till 12:00; estimated 250 sockeye, 3 Chinook and 800 pink salmon.
  - <sup>f</sup> Weir out due to high water; estimated 450 sockeye, 2,100 pink and 4 Chinook salmon.
  - <sup>g</sup> Weir out due to high water till 11:25 AM; estimated 150 sockeye, 800 pink and 1 Chinook salmon.
  - <sup>h</sup> Weir out due to high water; estimated 400 sockeye, 6,900 pink, 1 Chinook, 2 coho, and 2 chum salmon.
  - <sup>i</sup> Weir out due to high water until 12:10 PM; estimated 180 sockeye and 1,100 pink salmon.
  - <sup>j</sup> Weir out due to high water; estimated 2,167 sockeye, 34,720 pink, 14 coho and 4 chum salmon.
  - <sup>k</sup> Weir out due to high water for rest of season; post weir estimate of 45,000 sockeye, 219,000 pink, 123 coho, 20 chum and 1 Chinook salmon.

Table 12.—Ayakulik River cumulative escapement counts for Chinook salmon by year and average, 2001–2010.

<sup>a</sup> Weir fish tight at 16:00 on May 20.

<sup>b</sup> Pulled weir; includes post weir estimate of 500 sockeye and 300 coho salmon.

Table 28.—Upper Station escapement counts for early-run sockeye salmon by year and average, 2001–2010.

7-Oct <sup>i</sup>	0	6	0	9,800	5	6,808	0	15,781	0	67

*Note:* All species except sockeye salmon were counted at lower weir. Sockeye salmon were counted at Lake weir.

<sup>a</sup> Lake weir fish tight at 14:00 hours on May 21.

<sup>b</sup> Gate open for approximately 7 hours; estimated 275 sockeye through weir.

<sup>c</sup> Gate open again; no estimated escapements.

<sup>d</sup> Lower weir fish tight at 14:30 hours. Counts all from lower weir.

<sup>e</sup> Weir pulled at 05:00 due to high water; estimated 19 coho.

<sup>f</sup> Weir out due to high water; estimated 30 coho.

<sup>g</sup> Weir fish tight at 15:30; estimated 23 coho added to an actual count of 7 coho.

<sup>h</sup> Lower weir pulled.

<sup>i</sup> Lake weir pulled.

Table 38.—Buskin cumulative escapement counts for sockeye salmon by year and average, 2001–2010.
